(54) MANUFACTURE OF FINELY POROUS FILM AND MULTILAYER FILM

(57) Abstract:

PROBLEM TO BE SOLVED: To obtain a finely porous film of a uniform single layer or multilayer even under the conditions of resin solidify composition and elongation which cannot orienting it by area magnification of 1.1 to have obtained the film by prior art.

SOLUTION: The method for manufacturing a finely porous film comprises the steps of laminating and co-extruding a fine pore forming precursor layer (M layer) made of composition containing thermoplastic resin (A) for forming at least one layer of continuous phase by a multilayer die as a main body and COPYRIGHT: (C)1998,JPO

an auxiliary layer (S layer) containing a thermoplastic resin (C) different from the precursor layer of main purpose of improving film formability of at least one layer as a forming component, main predetermined thickness, then quenching to it via heat transfer medium, 30 times at least in one direction under temperature condition, ranging from 15°C to Vicat softening point +50°C of composition for forming the precursor layer (M layer) to form fine pores to obtain a multilayer film, and then releasing to remove the auxiliary layer to obtain the finely porous film.
